

01 / THE CUSTOMER PATH

Before you publish a Shopify theme.

A release checklist for the parts customers actually use. Start in a duplicate theme, using the intended products, market and payment test mode.

Try this	The pass condition
Choose every product variant	The selected variant, image, availability and price agree. A colour change must not silently revert the customer's size selection.
Add a product set	Every selected piece appears once, with the intended variant and quantity. Optional pieces stay optional. Related lines can be identified in the cart.
Use the least convenient state	Try a sold-out variant, a zero-priced accessory and a product without a variant image. The page explains the state and keeps a valid action available.
Review the bag on a phone	Names, options, quantities, remove controls and totals remain readable. The customer can return to the product without losing their place.
Continue to checkout	The selected market, shipping context and discount behaviour remain correct. Complete the intended test payment and check the resulting order.

Keep one short release record

Record the theme, date, tester, market, device and product variants. Attach the resulting test order or cart evidence. A tick beside “cart works” is not enough to reproduce a failure.

02 / THE AWKWARD CASES

A slow response is a different problem.

A shopper presses Add. The network goes quiet. The product may already be in the bag. Your recovery copy should account for that uncertainty.

Situation	What to test and explain
Two quick clicks	While a cart request is pending, one submission is in flight. The button communicates progress and prevents another click.
Stock changes after page load	The server can reject a previously available variant. Keep the selected items visible and display the readable stock message.
The response is lost	Do not silently repeat a cart mutation. Give the customer a way to inspect the cart before another attempt.
The shopper removes one piece	Decide whether the set is merely a group of separate lines or a true bundle. Check the intended price and inventory behaviour after removal.
A market uses another currency	Check displayed prices, currency formatting and the resulting cart. Do not treat a symbol swap as a market implementation.

A practical recovery message

“We couldn't confirm whether the set was added. Review your bag before trying again.” This tells the customer what is uncertain and gives them a useful next action.

Separate presentation from commerce rules

A shared line-item property can identify a set. It does not create bundle inventory or enforce a discount. Use the relevant Shopify capabilities when those rules are required.

03 / RELEASE AND HANDOFF

Make the next change easier to trust.

The person maintaining the theme should know what changed, how to test it and how to return to the previous version.

Handoff item	What belongs in it
Change note	The section or template changed, the reason, the affected products and any theme or app dependencies.
Acceptance evidence	Variant and cart checks, mobile screenshots, keyboard checks, error-path results and the test order used for checkout verification.
Rollback point	The previous published theme and any separately changed settings. A theme rollback does not automatically undo app, product or checkout configuration.
Owner and first review	Name who watches the release and who can make a correction. Inspect the customer path immediately after publication.

Open FIELDWORK

Try the original carry-set storefront, then download the configurable Shopify section. It includes Liquid, scoped styles, the cart adapter and installation notes. The public page uses a local bag; the package requires installation and QA in the intended store.

Explore the storefront and download the section
