

01 / PLAN THE PREFLIGHT

Five profiles to test before a welcome flow goes live.

A compact QA guide for a three-email welcome journey. The example assumes sends at signup, +24 hours and +48 hours.

Test profile	Expected decision
New subscriber, no purchase	All three acquisition messages remain eligible, subject to the account's other delivery rules.
Buys at +12 hours	Email one may already have sent. Emails two and three should skip when the send-time purchase rule is applied.
Withdraws consent at +12 hours	Later marketing messages must not send. Check the actual suppression and consent state, not only an earlier exported list.
Suppressed before entry	No marketing message should send. Confirm the account's handling of suppressed profiles in the actual journey.
Purchases exactly at a send boundary	Record the intended event ordering and test the platform behaviour. The local checker processes the event first; the live account may involve ingestion lag.

Use controlled test profiles

Use addresses and profiles your team controls. Keep test activity separate from customer reporting, and record the rule version you tested. The aim is to prove the decision path, not to send test campaigns to real customers.

02 / INSPECT THE MESSAGE

The rule can be right. The email can still be wrong.

Check what the customer sees after the audience decision has passed. Keep the product, promise and action aligned with their current state.

Check	Look for this
Subject and preview	They work together without repeating the same line. The preview does not expose leftover template text.
First screen on mobile	The reason for the message and the next action are clear. Headings wrap cleanly and buttons remain usable.
Images off	Essential meaning survives. Alt text describes the useful content; the offer or deadline is not available only inside an image.
Personalisation	A missing first name, product field or event property produces readable copy. Test the fallback explicitly.
Destination	Every link reaches the intended live page. Product availability, currency, offer terms and tracking parameters agree with the email.
Footer and preferences	The sender identity and preference/unsubscribe route work. Check the intended market and account settings before release.

One copy change after the purchase

Before buying, “Find the scent for your room” can help selection. After delivery, “A better first burn” can introduce product care. Repeating the acquisition pitch ignores the customer's new context. These are original copy examples for a candle-store exercise.

03 / LEAVE A USEFUL QA RECORD

Make a failed check easy to reproduce.

A short, complete record saves the next person from reconstructing your test. Use it for a correction, a handoff or a release review.

Field	Example entry
Journey and version	Welcome / three-email path / review candidate 03
Profile state	Subscribed at 09:00; purchase event available at 21:00; no suppression at entry
Expected behaviour	Email one sends. The send-time purchase check skips email two and email three.
Actual behaviour	Record the observed decision and time from the platform. Attach the actual receipt or screenshot; do not replace this field with the expected result.
If it fails	Record the filter, event timestamp and property values involved. Name the correction owner and repeat the same test after the change.
Release decision	List unresolved checks, dependencies and who can approve the release. Keep a reference to the previous journey configuration.

Run the rule checker

[Open the Welcome-Flow Check](#). Switch between purchase, signup, opt-out and suppression scenarios, then export the timeline. It is a rule model; it does not connect to Klaviyo or send messages.

Reference

[Klaviyo guidance on flow filters](#) explains entry and action-time evaluation. Verify the actual configured rules and account behaviour during preflight.
